Download

DroidCamX is an app made to improve the use of the webcam on your Android device, and it's free. This app provides a Linux service that will act as a remote controlled camera for your device, making it a webcam in the traditional sense. After installing the app, you can access the dashboard where you can control the camera. The Linux service will continuously run in the background, waiting to detect a new device so that it can be used. The app provides support for Skype, Google+, Facebook, Twitch, Periscope and many other live streaming platforms. All you have to do is configure the stream in the app to create a virtual webcam on your Android device. You can also use the app as an Android remote control. The software will allow you to activate and control your PC, Android device or Raspberry Pi from your computer. To use the app, you will have to create an account and generate a token. Once you've installed the app, you will be able to access the dashboard by opening the camera app and selecting the "Dashboard" tab. You will be presented with a list of cameras, and you can view them all by clicking the three dots. Once you've selected a camera, you will have to fill the Name, Identifier, Username, Password and API Key fields. The app will generate the parameters for you. The Name field is a unique ID that will be displayed to users, and it's this value that will be sent to the server so that it will know what the app is when receiving webcam requests. The Identifier is the identifier that will be sent to the server for authentication. The Username is the user that will be used for authentication. The Password is the password used for authentication. The API Key is a generated value that will be used for authentication to the remote server. Once you've filled all the fields, you will be able to configure the app and start streaming. The app has an interface that is similar to that of OBS, allowing you to create a virtual webcam on your PC and then send a stream to the camera. Once you've configured the app and started the stream, you can select the device by clicking on the icon at the top of the screen. The screen will display the name of your camera, the IP address, the device's 82157476af
