On Sept. 6, President Trump will make his first formal State of the Union address to a joint session of Congress, giving his final address to the nation before midterm elections. His speech is expected to carry a full day's worth of fodder for the political media. But the speeches over the last several years should provide a baseline for how he sounds and what he'll say. Although Trump tends to use unpredictable language, his speeches over the last three years follow a similar structure. He goes into some history, he says something positive (or at least noncontroversial), he says something critical of his opponents, he holds up a hypothetical image of a win and offers some policy detail on his priorities. These are a few of the key themes of his speeches over the last few years: **THE RUBBER-STAMPING MOMENT** Trump has traditionally introduced himself to the public by declaring his candidacy as a movement, rather than a person. But once Trump officially became the nominee of the Republican Party, he started to speak more as president, and less as a candidate. In the next few months of 2016, Trump used some of the same themes to introduce himself to the country as the Republican nominee. In the final days before the November election, Trump introduced himself as "the only candidate who will make America great again." This victory mantra was a sticking point for many Americans, and what inspired Trump to deliver one of the most memorable State of the Union addresses of all time. In the 2016 address, Trump declared, "This will be the moment when the fate of the Republic will be decided." In 2017 and 2018, it was more of the same. He often said things like "we will begin renegotiating NAFTA, on terms that will be fair and reciprocal." In 2019, though, Trump seemed to change the rhetoric. In his State of the Union speech, he used the phrase "America First." Trump's responses to trade policy questions in the State of the Union were also much more aggressive, and more in line with the rhetoric he delivered in 2017 and 2018. **THE STILL-OPEN ISSUE OF FOREIGN POLICY** Trump's views on foreign policy have always been muddled. With few exceptions — especially after the election — Trump has relied on his secretaries of State and Defense to provide his foreign policy voice. In his

See article on page 1008 for full text As the recent discovery of *ADRB3* has shown, there are still many unknown genes to explore in the complex picture of hypertension and atherosclerosis. Genetic studies could potentially help to design individualized treatments according to the individual patient, rather than the "one-size-fits-all" approach of traditional medical therapy. In addition, genetic information could help to find novel pharmacological targets and tools to develop novel antihypertensive drugs. Thus, an increasing number of genetic studies are being conducted in hypertension and cardiology. This special issue contains six reviews and eight original articles that give an overview of the current status of genetic research. Non-coding regions of the genome are often far from genes and, therefore, have been overlooked in the majority of genetic studies. These regions, as regions of low gene density, are known to have important regulatory roles in gene transcription and expression. In the article by B. K. Kaushik, the expression patterns of the repeat-containing region are first reviewed. Then, this article focuses on the role of the common variants (more than 1% minor allele frequency) located in the common repetitive elements in hypertension and coronary artery disease (CAD). The results show that there are common variants at the repetitive elements that are significantly associated with hypertension and CAD. This work indicates that these non-coding regions might contain important information regarding the pathogenesis of hypertension and CAD. A further attempt to examine the functional role of the common variants at the repetitive elements in hypertension and CAD is reviewed by P. A. de Belder. This work shows that the common variants at the repetitive elements are not only associated with the risk of hypertension, but also with the progression of hypertension. The exact role of these common variants at the repetitive elements in hypertension and CAD has to be further examined. Many data have already shown that the renin-angiotensin system (RAS) is a fundamental regulator of blood

pressure homeostasis and that its activation induces structural changes in the left ventricle and in arterial wall. The authors of the current review by M. Ferrario review the important role of RAS components in blood pressure homeostasis and discuss the role of renin, angiotensin-converting enzyme (ACE), angiotensin II receptors, and angiotensin-converting enzyme inhibitors (ACEIs) in hypertension, atherosclerosis, and coronary heart disease (CHD) with particular
